

REFLECTION

In this project, I learned how to design a website with HTML and styling it with CSS. I further developed how to arrange content with divs, headers, and footers. I also learned to employ CSS to design our gym website in a clean and modern way. Through this project, I enhanced my layout and formatting. I understood the significance of consistency in spacing, color, and font to give a professional look to the website. I also understood how crucial mobile responsiveness is for user experience. Making a fitness website taught me how to prioritize user needs, such as displaying workout plans and contact forms. Overall, I am more confident in web development now.

The hardest thing was getting the elements in line on various screen sizes. Sometimes the layout would break and we had to repair the CSS rules with care. It was difficult making the site both look nice and remain easy to use. Choosing the suitable colors and fonts which suit a fitness theme was not so quick. We had to review our code several times in order to correct minor errors. Another issue was ensuring that all buttons and links were functioning as they should. But we collaborated and resolved the problems step by step.

If I could change something, I would include more interactive elements such as a workout calculator or planner using JavaScript. I would further enhance the mobile version to better display it on phones. There could have been more videos and images included to make the site more interactive. I believe that we should include a feedback form for the users as well. More animations could make the site feel more dynamic. Finally, I would organize our code better to make updates easier.
